Meteorologische Beobachtungen

in

DEUTSCHLAND

von

25 Stationen II. Ordnung, sowie stündliche Aufzeichnungen
von 3 Normal-Beobachtungsstationen der Seewarte und von Kaiserslautern;
die Stürme nach den Signalstellen der Seewarte.

1884.

Jahrgang VII.

Herausgegeben von der Direktion der Seewarte.

HAMBURG, 1886.

Gedruckt bei Hammerich & Lesser in Altona

Jahrgang 1884.

I. Theil: Meteorologische Beobachtungen in Deutschland, angestellt an 25 Stationen zweiter Ordnung.

II. Theil: Stündliche Aufzeichnungen der autographischen Apparate für Luftdruck, Temperatur, Windrichtung und Windgeschwindigkeit an den drei Normal-Beobachtungsstationen der Deutschen Seewarte: Hamburg, Swinemünde und Keitum, sowie in Kaiserslautern.

III. Theil: Zur Statistik der Stürme an der Deutschen Küste.

Zur Notiz. Die Barometerstände der Stationen der Seewarte sind in allen Jahrgängen dieser Publikation (1876—1885) um 0.46 mm (abgerundet 0.5) zu hoch und müssen dementsprechend um diesen Betrag erniedrigt werden. Die Anbringung der obigen Korrektion in dieser Publikation wird erst mit dem Jahrgange 1886 erfolgen können, so dass also erst von letzterem Jahrgange an die Barometerstände unverändert genommen werden können.

Einleitung.

Der vorliegende Jahrgang VII „Meteorologische Beobachtungen in Deutschland" unterscheidet sich in seiner Form nicht von dem vorjährigen, enthält jedoch abweichend die Beobachtungen von Thorn an Stelle von Posen, wo die Beobachtungen von Juli ab nicht ausgeführt wurden, und zum ersten Male die meteorologischen Aufzeichnungen von Strassburg und Metz, sowie im II. Theile die Angaben der Registrir-Apparate in Kaiserslautern. Es entfallen von den 25 Stationen demnach je 8 auf die Beobachtungs-Systeme der Deutschen Seewarte und des Preussischen Meteorologischen Instituts, je 2 auf Württemberg, Baden, Bayern und Elsass-Lothringen, und 1 auf Sachsen.

Die geographische Lage und Seehöhe der Stationen, sowie die Namen der Herren Beobachter resp. der Leiter der Stationen finden sich am Schluss dieser Einleitung zusammengestellt.

Die orientirende Angabe über die Art, Aufstellung und Behandlung der Instrumente, sowie die Berechnung der Ablesungen finden sich meist in den früheren Jahrgängen; eine Wiederholung hat nur soweit stattgefunden, als es im Interesse der Selbständigkeit der Einzel-Publikation geboten schien.

Insbesondere seien hier zunächst die sich zerstreut vorfindenden Mittheilungen über die Ableitung der monatlichen Mittel-Temperaturen aus den Terminsmitteln resp. den Mitteln der Extrem-Temperaturen (Tages-Mittel auf Seite 152—165) sowie die Berechnung der Fünftägigen Wärmemittel (Seite 166—167) zusammengestellt. Wo Gegentheiliges nicht gesagt ist, wurde die Berechnung beider Grössen in gleicher Weise nach den folgend angegebenen Formeln ausgeführt:

Die **Stationen der Seewarte:** für die Pentaden-Mittel $\frac{1}{2}(8^a + 8^p)$, für die monatlichen „Tages-Mittel" von Mai bis August $\frac{1}{4}(\text{Min.} + 8^a + 2^p + \text{Max.})$, und von September bis April $\frac{1}{2}\left(\frac{8^a + 8^p}{2} + \frac{8^a + 2^p + 8^p}{3}\right)$.

Die **Preussischen Stationen:** $\frac{1}{3}(6^a + 2^p + 10^h)$, ausser **Schneekoppe** und **Eichberg**, wo zu anderen Terminen beobachtet wird; für diese wurde die Formel: $\frac{1}{4}(7^a + 2^p + 2 . 9^p)$ benutzt.

Kaiserslautern und **Nürnberg:** $\frac{1}{4}(\text{Min.} + 8^a + 2^p + 8^p)$.

Stuttgart und **Friedrichshafen:** }
Karlsruhe und **Höchenschwand:** } $\frac{1}{4}(7^a + 2^p + 2 . 9^p)$.

Strassburg und **Metz:** $\frac{1}{4}(7^a + 1^p + 2 . 9^p)$.

Für **Chemnitz** findet die Berechnung der Tagesmittel der Temperatur aus den arithmetischen Mitteln der 3 Terminsmittel unter Hinzufügung von Korrektionen statt, welche abhängig sind vom Monat und der täglichen periodischen Schwankung $2^p - \frac{1}{2}(8^a + 8^p)$. (Vgl. Jahrbuch des Königl. Sächs. Met. Instituts 1883, III. Theil, Seite 6). Dagegen sind die Pentadenmittel der Temperatur in Hamburg nach der Formel $\frac{1}{2}(8^a + 8^p)$ berechnet worden.

a. Die Stationen der Deutschen Seewarte.

Wie bisher wurden die Beobachtungen um 8^a, 2^p und 8^p ausgeführt, in Befolgung der „Instruktion für den Meteorolog. Dienst der Seewarte"; ebensowenig traten prinzipielle Aenderungen an der Ausrüstung der Stationen ein.

Einer Revision wurden i. J. 1884 alle Normalbeobachtungs-Stationen der Seewarte ausser Kiel unterzogen.

Bezüglich der Eintragungen sei hier wiederholt, dass das Maximum-Thermometer 8^a abgelesen und eingestellt wird und die Ablesungen für den laufenden Tag eingetragen werden, welches Prinzip auch hier im Druck (Seite 1—48) beibehalten wurde; die Maximum-Temperaturen beziehen sich also je auf den vorhergehenden Tag, was bei der Angabe der höchsten Temperatur der Monate bei den Jahres-Zusammenstellungen (Seite 152—155) berücksichtigt wurde.

Das Minimum-Thermometer wird 8^a abgelesen, um 2^p eingestellt, und die Ablesung konform mit dem vorliegenden Druck dem laufenden Tage zugeschrieben.

Der Regenmesser wird 8^a und 8^p entleert und der Niederschlag der Nacht plus dem des vorherigen Tages für diesen Tag eingetragen, so dass der laufende Niederschlagstag von 8^a bis am folgenden Tag 8^a gerechnet wird, während bei Zählung der übrigen Tage mit anderweitigen meteorologischen Erscheinungen der Kalendertag von Mitternacht bis Mitternacht zu Grunde gelegt ist.

Alle Barometerstände sind nur auf 0° Celsius und nicht auf das Meeresniveau angegeben; gegen voriges Jahr blieben die Seehöhen unverändert mit Ausnahme von Neufahrwasser, wo dieselbe am 1. April auf 8.26 Meter und am 21. Oktober auf 11.12 Meter abgeändert wurde.

Die **Psychrometer** haben die in der vorjährigen Publikation Seite IV angegebene Aufstellung behalten. Aus ihren Angaben wird die Feuchtigkeit der Luft wie früher nach den Psychrometer-Tafeln von Jelinek ohne Interpolation, d. h. mit Zugrundelegung des mittleren Barometerstandes von 755 mm, für welchen diese Tafeln berechnet sind, entnommen.

Die **Windrichtung** ist durchweg rechtweisend; die Termin-Beobachtungen der **Windstärke** sind Schätzungen nach der 12theiligen Beaufort-Skala und nicht aus den Anemometer-Angaben abgeleitet. Ebenso entspricht das Zeichen ⸙ im I. Theil der Schätzung stürmischer Winde durch die Beobachter. Im II. Theil (Seite 152—155) dagegen sind als Tage mit ⸙ bei den Stationen der Seewarte, mit Ausnahme von **Borkum**, wo ein Anemometer nicht funktionirte, die Tage gezählt, wo das Anemometer während mindestens einer Stunde 15 Meter und mehr pro Sekunde Windgeschwindigkeit im Durchschnitt registrirte.

Die **Monatsmittel** aus den 3 Terminen im I. Theile (Jahres-Zusammenstellung) sind als arithmetrische Mittel berechnet, mit Ausnahme der mittleren „Tagesmittel“ der Temperatur, deren Ableitung oben zugleich mit derjenigen der **fünftägigen Mittel** angegeben wurde.

Als **Niederschlagstage** wurden alle Tage (8^a bis 8^a) gerechnet, an welchen überhaupt Niederschlag von ● ✳ △ oder ▲ beobachtet wurde, unabhängig davon, ob messbar oder nicht; Niederschläge, welche von ⌓ oder ⌴ herrührten, wurden nicht berücksichtigt. Nicht messbare Niederschläge sind durch 0.0 angedeutet.

Als **Tage mit Gewitter** wurden nur Tage gezählt, an welchen Blitz und Donner oder auch nur Donner beobachtet wurden, während blosses Wetterleuchten bei dieser Zählung nicht berücksichtigt wurde.

Als **heitere** resp. **trübe Tage** wurden diejenigen gezählt, an welchen die Bewölkung im arithmetrischen Mittel aus den 3 Beobachtungen des Tages kleiner als 2, resp. grösser als 8 war.

Bezüglich der Aufstellung und der Gattung der selbstregistrirenden Instrumente hat sich in **Swinemünde** und **Keitum** gegen die Angaben des vorigen Jahrganges nichts geändert. In **Hamburg** wurde vom 7. April 9^h a. m. ab der Barograph von Dr. Sprung, welcher unter Anderm in „Aus dem Archiv der Seewarte“ (VII. Jahrgang, No. 2, Seite 29) beschrieben ist, zu den vorliegenden Aufzeichnungen benutzt, und nur bei Störungen traten die Angaben des Thermo-Barographen von Dr. Schreiber an die Stelle; die Aufzeichnungen der Temperatur wurden dagegen dem letzteren Instrument entnommen, bei Störungen in seinem Gange dagegen dem Hipp'schen Thermographen.

Der dem Schreiber'schen Thermo-Barographen als Gefäss dienende Kupfer-Zylinder befindet sich dicht unter dem, vor einem Nordost- („Meteorologischen“) Fenster gelegenen, Thermometer-Gehäuse der Seewarte, gegen Strahlung vom Boden und gegen die Morgensonne vollständig geschützt. Der Hipp'sche Thermograph ist in einer der Wild'schen ähnlichen Thermometer-Hütte über dem Reservoir im Garten der Seewarte aufgestellt. — Genauere Angaben finden sich in „Aus dem Archiv der Deutschen Seewarte“, Jahrgang 1884, No. 2, Seite 24 und, die Thermometer-Hütte betreffend, Jahrgang 1879, No. 3, Seite 7 und Jahrgang 1884, No. 2, Seite 30.

Folgende Tabelle zeigt übersichtlich, welche Registrir-Aufzeichnungen bisher in diesen Jahres-Publikationen veröffentlicht wurden, wobei zu bemerken, dass die in den Serien hervortretenden Lücken theilweise durch Ausfall der Beobachtungen in dem betreffenden Jahre, theils auch durch andere, den Umfang der Publikation bestimmende Gründe mit verursacht wurden. Es bedeuten *A* den Anemograph, *B* den Barograph, *T* den Thermograph.

b. Die Preussischen Stationen. *)

Zu den in früheren Jahrgängen veröffentlichen Beobachtungen treten in diesem Jahrgange neu hinzu die Beobachtungen der Station Thorn, während die im Jahre 1884 unvollständige Beobachtungsreihe von Posen keine Aufnahme gefunden hat.

Die Beobachtungszeiten sind 6^a, 2^p und 10^p, nur für Eichberg und Schneekoppe sind dieselben 7^a, 2^p und 9^p.

Die Seiten 49 bis 96 vorliegender Publikation, welche die Beobachtungen der dem Königlich Preussischen meteorologischen Institut angehörigen Stationen enthalten, sind Sonderabdrücke aus „Ergebnisse der meteorologischen Beobachtungen im Jahre 1884. Veröffentlicht vom Königlichen Meteorologischen Institut. Berlin 1885“ (Preussische

*) Die Berechnung der Mittelwerthe der Temperaturen ist oben Seite III angegeben.

Statistik, Heft LXXXII), die gemäss einer zwischen der Deutschen Seewarte und dem Preussischen Meteorologischen Institut getroffenen Vereinbarung zur Herstellung des gemeinschaftlichen Druckwerkes geliefert werden.

Die Notirung der Hydrometeore im Momente der Beobachtung, wie sie das Comité des internationalen Meteorologen-Kongresses von Rom auf einer Sitzung in Bern (1880) empfahl, ist bei allen Stationen in der Weise erfolgt, dass bei der die Bewölkung ausdrückenden Zahl ein Kreuz (z. B. 8†) beigefügt ist, während die Unterstreichung derselben (z. B. 10) bedeutet, dass die Beobachtungs-Station im Momente der Notirung sich im Nebel befand. Ob der Niederschlag, welchen das Kreuz (†) andeutet, in der Form von Regen, Schnee u. s. w. gefallen ist, ersieht man ohne Weiteres aus der nebenstehenden Spalte „Bemerkungen“.

Die bei der Station Schneekoppe bisweilen vorkommende Bemerkung: h ═, bedeutet, dass es oben heiter ist, unten aber Nebel liegt.

Als Niederschlags-Tage sind die Tage gezählt, an welchen die Niederschlagsmenge mehr als 0.2 mm betrug.

Bei der Aufstellung der Monats- und Jahres-Uebersichten wurden die benachbarten Stationen systematisch unter einander verglichen und dabei einzelne Ungenauigkeiten aufgedeckt, die theils durch Korrespondenz mit den Beobachtern erledigt, theils auf prinzipielle Fehler zurückzuführen sind; so kommt es z. B. öfters vor, dass der eine Beobachter zur Ueberschätzung, der andere zur Unterschätzung der Himmels-Bedeckung geneigt ist. In diesen und ähnlichen Fällen sind die betreffenden Zahlen mit einem Fragezeichen versehen worden. Dr. **Hellmann.**

c. Die Württembergischen Stationen.*)

Eine Aenderung in der Aufstellung der Instrumente hat nicht stattgefunden. Prof. Dr. **Zech.**

d. Die Bayerischen Stationen.*)

Bezüglich der zwei bayerischen Stationen, Kaiserslautern und Nürnberg, gilt das im vorigen Jahrgange Angegebene unverändert. In Nürnberg trat durch den Tod des Herrn Prof. Dr. Biehringer ein Wechsel der Beobachter ein, indem gegen Ende April Herr Lehramts-Assistent Trötsch interimistisch eintrat und am 1. Oktober neben dem bisherigen II. Beobachter, Herrn Garnison-Apotheker a. D. Fraas, der Professor an der Kgl. Industrieschule, Herr Staudacher, als I. Beobachter vom K. B. Staats-Ministerium bestätigt wurde. Dr. **C. Lang.**

Der Barograph von Hipp in Kaiserslautern befindet sich im nordwestlichen Flügel der Kreis-Realschule, eine Treppe hoch, neben dem Stations-Barometer, und ist so angebracht, dass seine Kapseln 20 cm über dem Niveau des Barometers und demnach 242.4 Meter über dem Meeresspiegel liegen.

Der Thermograph von Hipp ist vor einem nach Nordwesten gerichteten Fenster des Stationszimmers in einem Gehäuse mit Blech-Jalousien aufgestellt.

Das Anemometer befindet sich in der Mitte des Dachfirstes des Realschulgebäudes; sein Schalenkreuz erhebt sich 1.60 Meter über den First und 21.33 Meter über den Erdboden. **Nipeiller.**

e. Die Sächsische Station.*)

Eine Aenderung ist nicht eingetreten und gelten somit die Angaben des vorigen Jahrganges.
Dr. **Paul Schreiber.**

f. Die Badischen Stationen.*)

Bezüglich dieser Stationen wird auf die früheren Einleitungen verwiesen. Baudirektor **Honsell.**

g. Die Stationen der Reichslande.*)

Die meteorologischen Stationen in den Lehrer-Seminarien zu Strassburg und Metz sind in gleicher Weise mit Gefäss-Barometer, Psychrometer, Regenmesser und Windfahne ausgestattet; Maximum- und Minimum-Thermometer waren im Jahre 1884 noch nicht vorhanden.

Die Gefäss-Barometer von Herrmann & Pfister in Bern sind mit Millimeter-Skala und zehntheiligem Nonius versehen. Der Querschnitt der Röhre verhält sich zu dem des Gefässes wie 1 : 100. Das Thermometer am Barometer ist in ganze Grade getheilt. Als Normal-Barometer zur Vergleichung dient ein Heber-Barometer (Greiner No. 443), das von Herrn Dr. Sprung aus Hamburg verglichen, gegen das Kontroll-Barometer (Fuess Nr. 10) der Deutschen Seewarte die Korrektion —0.05 mm ergab. Das Gefäss-Barometer der Station Strassburg wird vierteljährlich mit diesem Barometer (443) verglichen; es ergaben sich in den drei letzten Jahren kaum merkliche Differenzen. Das Barometer in Metz wird jährlich einmal kontrolirt; es ergaben sich als Korrektionen im September 1883 —0.3 mm, Sept. 1884 —1.0 mm, Sept. 1885 0.0 mm; da nach jeder Prüfung der Nullpunkt der Barometer-Skala korrigirt wird, so hat vom 9. Sept. 1884 ab keine Aenderung des Standes mehr stattgefunden.**)

*) Die Berechnung der Mittelwerthe der Temperaturen ist oben Seite III angegeben.

**) Die Seite 149 erwähnte, als vom 9. September an angebrachte, Korrektion von —1.0 mm wurde also durch Verschieben des Nullpunktes gleich an der Ablesung angebracht.

Die Thermometer sind in $^1/_5$ Grade getheilt; sie werden jährlich in schmelzendem Schnee auf den Nullpunkt geprüft. Die Korrektionen, die schon seit mehreren Jahren in Metz —0.5° für das trockene und feuchte Thermometer, in Strassburg —0.3° resp. —0.4° betragen, werden sofort bei jeder Ablesung in Rechnung gebracht.

Die Regenmesser haben eine kreisrunde Auffangefläche von $^1/_{25}$ qm., die Messgläser geben Zehntel Millimeter an.

Die Windfahne der Station Strassburg ist mit vierarmiger Windrose versehen; die von Metz hat keine Windrose. Die Windstärken werden nach der Manheimer Skala (0—4) geschätzt.

Die Barometer sind je in einem kühlen aber frostfreien Hausflur der Seminargebäude aufgehängt und werden von den Sonnenstrahlen nicht getroffen. Die Thermometer und Regenmesser befinden sich an möglichst freier Stelle des Seminarhofes. Die Thermometer hängen in einem Zinkgehäuse, das in einem mit Jalousien versehenen hölzernen Gehäuse steht. Die Höhe des Barometers über dem Meere beträgt in Strassburg 146 Meter, die der Auffangefläche des Regenmessers resp. des Nullpunktes der Thermometer über dem Erdboden 1.4 resp. 1.5 Meter; in Metz sind die entsprechenden Grössen 182, 1.4 und 1.1 Meter.

Die Thermometerstände sind auf 0° C. reduzirt, die absolute und relative Feuchtigkeit nach den Jelinek'schen Tafeln für Zehntelgrade, aber ohne Berücksichtigung des Barometerstandes, ermittelt.

Die Ablesungszeiten sind 7^a, 1^p, 9^p, für die Niederschläge 7^a des folgenden Tages.

Ablesungen und Aufzeichnungen wurden ausgeführt durch Seminaristen, in Metz unter Leitung des Lehrers Lemoine, in Strassburg unter Leitung des Unterzeichneten. **Hipp**, Seminarlehrer.

Beobachtungen an den Signalstellen der Seewarte zur Zeit unruhiger Witterung.

Die seit dem Jahre 1878 eingeführte Sturm-Statistik wurde auch in diesem Jahre, analog den früheren Jahrgängen für die deutsche Nord- und Ostseeküste durchgeführt.

Von den Aufzeichnungen an den Signalstellen wurden nur Rixhöft und Altona bei dieser Publikation ausgeschlossen; erstere Station wegen mangelhafter Ausfüllung der Tagebuchblätter und letztere der Nähe Hamburgs wegen, während andererseits Leba seit dem 1. Aug. wieder mit aufgenommen und Neuwerk seit dem 1. Oktober neu hinzugekommen ist.

Nur solche Fälle wurden hier zur Veröffentlichung gebracht, in welchen stürmische Winde auf grösserem Gebiete auftraten.

Die römischen Zahlen I, II und III bezeichnen die Beobachtungsstunden resp. 8^h a. m., 2^h p. m. und 8^h p. m.

Die neben diesen stehenden und auch in den Bemerkungen angewandten und durch den Druck hervorgehobenen arabischen Zahlen geben das Datum an.

Die Bewölkung wird durch die Ausfüllung der Kreise bezeichnet, wie dieses auch in den synoptischen Karten der Seewarte geschieht. Ebenso wurde für Regen das Zeichen • gesetzt.

Die eingeklammerten Zahlen neben der Bewölkung bezeichnen den Seegang und zwar:

0 = schlicht,	5 = ziemlich grobe (unruhige) See,
1 = sehr ruhig,	6 = grobe See,
2 = ruhig,	7 = hoch,
3 = leicht bewegt,	8 = sehr hoch,
4 = mässig bewegt,	9 = äusserst (gewaltig) hoch.

In den Bemerkungen bedeuten die Abkürzungen und die den Kongress-Beschlüssen entsprechenden Zeichen:

ab. = abends, mg. = morgens,	● Regen,	Nordlicht,
tg. = tags, mtg. = mittags,	✳ Schnee,	← Eisnadeln,
a. resp. a. m. = vormittags,	Schneegestöber,	Glatteis,
p. resp. p. m. = nachmittags,	▲ Hagel,	starker Wind,
a und p — als Exponenten bei der Tagesstunde — Abkürzung für a. m. und p. m.	△ Graupeln,	Gewitter,
	▬ Nebel,	< Blitze, Wetterleuchten,
	Thau,	⦶ Sonnenhof,
0^p resp. 12^a = Mittag,	Reif,	⊕ Sonnenring,
0^a resp. 12^p = Mitternacht,	⌒ Regenbogen,	Mondhof,
n. = in der (vorhergehenden) Nacht,	V Duftanhang, Rauhfrost,	Mondring.
	∞ Dunst oder Höhenrauch,

Die Temperaturen sind vom 21. Mai 12h a. m. bis 22. 10h p. m., vom 31. Mai 10h a. m. bis 3. Juni 9h a. m., vom 12. Juni 10h a. m. bis 13. 9h a. m. nach dem Hipp'schen Thermographen gegeben. Diese Zahlen wurden bei Berechnung der Mittelwerthe für Mai und Juni, ausgenommen am 12. und 13. Juni, nicht berücksichtigt, wegen grosser Abweichungen von den Termin-Beobachtungen am Tage bei heiterem Himmel.

Juli 1884. Temperatur (in Celsius-Graden). Hamburg.

Meteorologische Beobachtungen

in

DEUTSCHLAND

von

25 Stationen II. Ordnung, sowie stündliche Aufzeichnungen von 3 Normal-Beobachtungsstationen der Seewarte und von Kaiserslautern; die Stürme nach den Signalstellen der Seewarte.

1885.

Jahrgang VIII.

Herausgegeben von der Direktion der Seewarte.

HAMBURG, 1887.

Gedruckt bei Hammerich & Lesser in Altona.

Jahrgang 1885.

I. Theil: Meteorologische Beobachtungen in Deutschland, angestellt an 25 Stationen zweiter Ordnung.

II. Theil: Stündliche Aufzeichnungen der autographischen Apparate für Luftdruck, Temperatur, Windrichtung und Windgeschwindigkeit an den drei Normal-Beobachtungsstationen der Deutschen Seewarte: Hamburg, Swinemünde und Keitum, sowie in Kaiserslautern.

III. Theil: Zur Statistik der Stürme an der Deutschen Küste.

Zur Notiz. Die Barometerstände der Stationen der Seewarte sind in allen Jahrgängen dieser Publikation (1876—1885) um 0.46 mm (abgerundet 0.5) zu hoch und müssen dementsprechend um diesen Betrag erniedrigt werden. Die Anbringung der obigen Korrektion in dieser Publikation wird erst mit dem Jahrgange 1886 erfolgen können, so dass also erst von letzterem Jahrgange an die Barometerstände unverändert genommen werden können.

Einleitung.

Der vorliegende Jahrgang VIII „Meteorologische Beobachtungen in Deutschland“ unterscheidet sich seinem Inhalt nach von dem vorjährigen nur durch das Fehlen der Barographen-Aufzeichnungen der Station Keitum, welche nicht rechtzeitig druckfertig herzustellen waren; die Form ist unverändert beibehalten. Es entfallen von den 25 Stationen demnach je 8 auf die Beobachtungs-Systeme der Deutschen Seewarte und des Preussischen Meteorologischen Instituts, je 2 auf Württemberg, Baden, Bayern und Elsass-Lothringen, und 1 auf Sachsen.

Die geographische Lage und Seehöhe der Stationen, sowie die Namen der Herren Beobachter resp. der Leiter der Stationen finden sich am Schlusse dieser Einleitung zusammengestellt.

Alle erforderlichen Angaben über die Art, Aufstellung und Behandlung der Instrumente, die Berechnung ihrer Ablesungen, sowie die noch nöthigen Erläuterungen für den II. Theil finden sich in den früheren Jahrgängen. Eine Wiederholung ist also nicht erforderlich, und es werden vorliegend nur wenige Bemerkungen ergänzend und klarer erläuternd, die Stationen der Seewarte betreffend, hinzugefügt.

Es sei wegen des Zeichens n. (nachts) im II. Theile in der Rubrik „Bemerkungen“ allgemein hervorgehoben, dass dasselbe die vorhergehende Nacht bezeichnet; eine Abweichung findet in der Publikation nur statt, wie es auch sofort hervortritt, für Stuttgart pro Januar bis April, und für Elsass-Lothringen, wo n. die folgende Nacht bezeichnet.

a. Die Stationen der Deutschen Seewarte.

Bezüglich der Zahlen der Tage mit gewissen meteorologischen Erscheinungen, welche im I. Theile Aufnahme finden, wurde im vorigen Jahrgange bemerkt (S. III), dass, abgesehen von den Tagen mit ● ✱ ▲ △, wo der Tag von 8^a bis 8^a gerechnet wird, die Zeit von Mitternacht bis Mitternacht zu Grunde gelegt wurde. Dies entspricht dem Sachverhalt nur soweit, als die in der Nacht stattgehabten Erscheinungen durch die Angaben, ob abends oder früh, für den richtigen Kalendertag eingetragen werden konnten. Bei der blossen Notirung n. kommt für eine vor Mitternacht stattgehabte meteorologische Erscheinung das betreffende meteorologische Zeichen in die für den folgenden Kalendertag bestimmte Reihe zu stehen, und da einfach die Anzahl der Reihen mit diesen Zeichen gezählt werden, so kann das Ergebniss der Zählung bisweilen ein anderes sein, als es die Begrenzung der Tage durch die Mitternacht liefern würde.

Das Zeichen ⌐ш im I. Theile bezeichnet in diesem Jahrgange sowohl beobachtete Windstärken von 8 und mehr der Beaufort-Skala als auch die Stunden, an welchen das Anemometer der Station 15 Meter und mehr pro Sekunde Windgeschwindigkeit im Stundendurchschnitt registrirte. In Borkum funktionirte das Anemometer von Juni ab.

Die Zählung der Tage mit ⌐ш im I. Theile ist dieselbe wie im vorigen Jahrgange angegeben.

Von der Behandlung der Extrem-Thermometer, wie sie im vorigen Jahrgange angegeben wurde, ist bisher in Memel abgewichen worden, indem dort durch ein Missverständniss das Minimum-Thermometer stets bei der Morgen-Beobachtung eingestellt worden ist.

Die Ablesungen an den Extrem-Thermometern sind durchweg mit den Termin-Beobachtungen verglichen, und wo Widersprüche sich zeigten, sind die betreffenden zweifelhaften Notirungen jedes Mal durch die der Termin-Beobachtungen ersetzt worden, indem diesen mehr Gewicht beigemessen wurde.

b. Die Stationen der übrigen Beobachtungs-Systeme.

Eine Aenderung in der Aufstellung und Behandlung der Instrumente, wie in der Person der Beobachter ist nirgends eingetreten.

Es verdient zu den früheren Erläuterungen nur hinzugefügt zu werden, dass im I. Theile für die Station Klaussen die Zeichen M. R. und A. R.: Morgen- resp. Abendroth bedeuten.

Beobachtungen an den Signalstellen der Seewarte zur Zeit unruhiger Witterung.

Die seit dem Jahre 1878 eingeführte Sturm-Statistik wurde auch in diesem Jahre, analog den früheren Jahrgängen, für die deutsche Nord- und Ostseeküste durchgeführt.

Von den Aufzeichnungen an den Signalstellen wurden nur Rixhöft und Altona bei dieser Publikation ausgeschlossen; erstere Station wegen mangelhafter Ausfüllung der Tagebuchblätter und letztere der Nähe Hamburgs wegen.

Nur solche Fälle wurden hier zur Veröffentlichung gebracht, in welchen stürmische Winde auf grösserem Gebiete auftraten.

Die römischen Zahlen I, II und III bezeichnen die Beobachtungs-Stunden resp. 8^h a. m., 2^h p. m. und 8^h p. m.

Die neben diesen stehenden und auch in den Bemerkungen angewandten und durch den Druck hervorgehobenen arabischen Zahlen geben das Datum an.

Die Bewölkung wird durch die Ausfüllung der Kreise bezeichnet, wie dieses auch in den synoptischen Karten der Seewarte geschieht. Ebenso wurde für Regen das Zeichen • gesetzt.

Die eingeklammerten Zahlen neben der Bewölkung bezeichnen den Seegang und zwar:

0 = schlicht,
1 = sehr ruhig,
2 = ruhig,
3 = leicht bewegt,
4 = mässig bewegt,
5 = ziemlich grobe (unruhige) See,
6 = grobe See,
7 = hoch,
8 = sehr hoch,
9 = äusserst (gewaltig) hoch.

In den Bemerkungen bedeuten die Abkürzungen und die den Kongress-Beschlüssen entsprechenden Zeichen:

ab. = abends, mg. = morgens,
tg. = tags, mtg. = mittags,
a. resp. a. m. = vormittags,
p. resp. p. m. = nachmittags,
a und p — als Exponenten bei der Tagesstunde — Abkürzung für a. m. und p. m.
0^p resp. 12^a = Mittag,
0^a resp. 12^p = Mitternacht,
n. = in der (vorhergehenden) Nacht,

● Regen,
✱ Schnee,
+ Schneegestöber,
▲ Hagel,
△ Graupeln,
≡ Nebel,
⌓ Thau,
⊔ Reif,
⌒ Regenbogen,
V Duftanhang, Rauhfrost,
∞ Dunst oder Höhenrauch,

Nordlicht,
← Eisnadeln,
